

Water Quality Monitoring Results

Longview's water is monitored for over 170 contaminants, including pesticides, at the water treatment facility. In addition, Public Works Department personnel collect samples from throughout the distribution system to test for coliform, chlorine levels, lead, and copper. The SDWA requires water systems to report annually on any contaminants *detected* in drinking water. In accordance with Washington State Office of Drinking Water recommendations, contaminants monitored but not detected are not identified in this report. All primary contaminants detected, regardless of level, are identified in this table. Unless otherwise noted, contaminants are measured in *parts per million* (ppm) or *parts per billion* (ppb). To add perspective, one ppm is roughly one inch in sixteen miles.

Contaminant	Date Tested	Unit	MCL	MCLG	Detected Level	Major Sources	Violation
Iron	8/08	ppb	300	N/A	28	Erosion of natural deposits	No
Manganese	8/08	ppb	50	N/A	15	Erosion of natural deposits	No
Turbidity	Continuous monitoring			1 NTU	.2 NTU	Erosion	No
Lead	8/07	ppb	2	15*	1.44	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives	No
Copper	8/07	ppb	200	1300*	19.2	Corrosion of household plumbing systems, erosion of natural deposits	No

*Samples for lead and copper are subject to action levels. An action level is the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Contaminant	Date Tested	Unit	MRDL	MRDLG	Detected Level	Major Sources	Violation
Haloacetic Acid	12/08	ppb	60	60	29	By-product of chlorination used for drinking water disinfection	No
Total Organic Carbon	4/08	ppb	TT	TT	660	By-product of chlorination used for drinking water disinfection	No
Total Trihalomethanes	12/08	ppb	80	N/A	64.6	By-product of chlorination used for drinking water disinfection	No

The City of Longview meets or exceeds every water quality testing requirement. However, the required frequency for different types of water quality tests varies. The values in these tables represent the most recent monitoring results.

Note: The City of Longview is changing from a surface water source to a ground water source. Since cryptosporidium occurs only in surface water systems, the Washington State Office of Drinking Water granted Longview a waiver from this monitoring requirement in 2007.

Important Definitions

MCL = Maximum Contaminant Level. The highest level of a contaminant allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG = Maximum Contaminant Level Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

TT = Treatment Technique. A required process intended to reduce the level of a contaminant in drinking water.

MRDL = Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG = Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NTU = Nephelometric Turbidity Units. A unit of measurement for light refraction.

Turbidity = A unit of measure for water clarity and many indicate the presence of contaminants.

Cowlitz River near Longview Regional Water Treatment Plant intake after Mt. St. Helens eruption May, 1980.

2009 Water Quality Report

This is your 2009 Water Quality Report, also referred to as a Consumer Confidence Report. The Federal Safe Drinking Water Act (SDWA) requires water utilities to provide detailed water quality information to each customer annually.

This information is provided so that you, the consumer, are better informed about the quality of the water you drink.

So, what's the bottom line?

Longview's water meets or exceeds state and federal standards. Your water is tested regularly at laboratories certified by the State of Washington to perform these tests. State and federal regulators routinely monitor our compliance and testing protocols to assure safe delivery of drinking water to you. If you have questions or comments about the information in this report, please call the Longview Regional Water Treatment Plant at 360.442.5681, or the Utilities Operations Center at 360.442.5700. We welcome your interest in Longview's water system.

The Source of Longview's Water

The Longview Regional Water Treatment Plant takes water from the Cowlitz River about five miles north of its confluence with the Columbia River. The water is pumped across the Westside Highway to the plant from a pump station on the west bank of the Cowlitz. The average rate of pumping is about 8,000 gallons per minute (gpm), and sometimes as high as 12,000 gpm.

Due to the sediment conditions in the Cowlitz River, along with fisheries and endangered species regulations and the need for significant upgrades at the existing treatment plant, the City of Longview is developing a new groundwater supply to be the source of its drinking water. The new water supply source, expected to be completed in September 2012, will consist of four high capacity (4,000 gpm) groundwater wells and a new treatment plant constructed in the Mint Farm Industrial Park near

Washington Way and Industrial Way. This new water supply will comply with all drinking water regulations and will supply high quality water to meet the communities' needs for many years.

Additional Information about Water Quality

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive materials. It can also pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in water sources are microbes, pesticides, herbicides, organic or inorganic chemicals, and radioactive materials.

To ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) sets the amount of certain contaminants that can be present in water provided by public water systems. The Food and Drug Administration (FDA) sets the limits for contaminants in bottled water. Drinking water, including bottled water, may contain small amounts of some contaminants. Per the EPA and FDA, the presence of small amounts of contaminants does not necessarily pose a health risk. If you would like more information about these contaminants, please contact the U.S. Environmental Protection Agency's Safe Drinking Water Hotline at 800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general public. Some persons with weaker immune systems, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections caused by some contaminants. These individuals should seek advice about drinking water from their health care providers. Guidelines from the EPA and Centers for Disease Control on appropriate means to lessen the risk of infection by certain contaminants are available from the Safe Drinking Water Hotline.

Be water wise

... and quit throwing money down the drain!

◆ **Fix leaks.** A single dripping faucet can waste far more water in a single day than one person needs for drinking in an entire week. Conserve water and save money by finding and fixing leaks.

1. Locate your water meter. It is usually found in a meter box in a small concrete vault near the street. (Contact your Water Division at 442.5700 if you need assistance locating your water meter.)
2. Turn off all water using appliances in the home. This includes all indoor and outdoor faucets.
3. Check and record the current meter reading.
4. Wait a minimum of 15 minutes, the longer the better. Remember, do not use any water while you are waiting!
5. Read the meter again. If the reading has changed, then you have a leak that requires immediate attention.

Many leaks (dripping faucets or showerheads) are caused by worn washers which are easy to fix. Your local hardware, plumbing supply or home improvement store will have the correct parts and complete do-it-yourself instructions. If replacing the washer does not work or the problem is more complicated, contact a certified plumber for assistance.

TIP: Locate the master water supply valve and label it. The master supply valve can then be easily turned off in case of a leak or broken pipe.

◆ **Indoor water (and money) savers.** Only wash dishes when necessary. Turn the dishwasher on only

when it is full. ◆ Use both sides of the sink when washing dishes by hand. Use one side to wash and the other side to rinse. Do not wash dishes under a running faucet. ◆ Install aerators for every faucet in the house. ◆ Keep a bottle or pitcher of drinking water in the refrigerator. This eliminates letting the tap run while waiting for the water to get cold. ◆ Clean vegetables in a pan of water and not under a running faucet. Water used to clean vegetables can also be used to water plants.

In-sink garbage disposals use roughly 11.5 gallons of water each day. Try composting organic wastes instead of throwing them away.

◆ **Efficient water use is critical to a healthy and clean environment.** Fish, trees and animals depend on wise use of our limited water supplies. The following tips can help you save water (and money) outdoors.

The lawn is getting dry when footprints remain after walking on it. Water in short repeated intervals for best absorption, especially on slopes or compacted soils. ◆ Prevent water runoff from your sprinkler system. To reduce evaporation, water the lawn in the early morning or evening. Avoid watering during the heat of the day or when it is windy. ◆ Install a trickle or drip irrigation system for a slow, steady supply of water to the plant roots.
